DHS COMPARATIVE STUDIES

Education

**DEMOGRAPHIC
AND HEALTH
SURVEYS**

The Demographic and Health Surveys (DHS) is a 13-years project to assist government and private agencies in developing countries to conduct national sample surveys on population and maternal and child health. Funded primarily by the U. S. Agency for International Development (USAID), DHS is administered by Macro International Inc. in Calverton, Maryland.

The main objectives of the DHS program are (1) to promote widespread dissemination and utilization of DHS data among policymakers, (2) to expand the international population and health database, (3) to advance survey methodology, and (4) to develop in participating countries the skills and resources necessary to conduct high-quality demographic and health surveys.

For information about the Demographic and Health Surveys program, write to DHS, Macro International Inc., 11785 Beltsville Drive, Suite 300, Calverton, MD 20705, U.S.A. (Telephone 301-572-0200; Fax 301-572-0999).

Preface

One of the most significant contributions of the DHS program is the creation of an internationally comparable body of data on the demographic and health characteristics of populations in developing countries. The *DHS Comparative Studies* series and the *DHS Analytical Reports* series examine these data across countries in a comparative framework, focusing on specific topics.

The objectives of the DHS comparative research are: to describe similarities and differences between countries and regions, to highlight subgroups with specific needs, to provide information for policy formulation at the international level, and to examine individual country results in an international context. While *Comparative Studies* are primarily descriptive, *Analytical Reports* utilizes a more analytical approach.

The comparative analysis of DHS data is carried out primarily by staff at the DHS headquarters in Calverton, Maryland. The topics covered are selected by staff in conjunction with the DHS Scientific Advisory Committee and USAID.

The *Comparative Studies* are based on a variable number of data sets reflecting the number of countries for which data were available at the time the report was prepared. Each report provides detailed tables and graphs for countries in four regions: sub-Saharan Africa, the Near East and North Africa, Asia, Latin America and the Caribbean. Survey-related issues such as questionnaire comparability, survey procedures, data quality, and methodological approaches are addressed in each report, as necessary. Where appropriate, data from previous DHS surveys are used to evaluate trends over time.

Comparative Studies published under the current phase of the DHS program (DHS-III) are, in some cases, updates and expansions of reports published earlier in the series. Other reports, however, will cover new topics that reflect the expanded substantive scope of the DHS program.

It is hoped that the availability of comparable information for a large number of developing countries will have long-term usefulness for analysts and policymakers in the fields of international population and health.

Martin Vaessen
Project Director

Acknowledgments

The author wishes to thank Ann Blanc and Sunita Kishor for their time-consuming critical, detailed, and extremely helpful reviews of this report. The many revisions of the tables were produced with unfailing good humor and seemingly infinite patience by Jim Otto, Hendrik Ridders, and Guillermo Rojas. Juan Schoemaker provided invaluable early help, guidance, and impetus.

Executive Summary

Education is a crucial factor in national social and economic development and in individual development and fulfillment as well. The Demographic and Health Surveys (DHS) provide a rich source of information on this topic through the collection and publication of data on educational patterns and levels of achievement for numerous developing countries. DHS education data have been analyzed to some extent in individual country reports and in numerous comparative studies. Before this volume, however, no DHS publication focused specifically on education.

The goal of this report is to provide basic information on school attendance and educational attainment for countries surveyed in the DHS-II and DHS-III projects. This goal is accomplished through a series of tables and figures showing comparable data for 39 countries in sub-Saharan Africa, the Near East/North Africa, Asia, and Latin America and the Caribbean.

The data presented in this report confirm the continuing existence of major differences in school attendance levels and educational attainment across and within the regions and countries of the developing world. Substantial variations in educational levels are found within countries with respect to gender, age, and rural-urban residence. In general, these variations are in the expected direction: Males have higher educational attendance and attainment than females, younger age groups are generally better educated than older age groups, and the populations of urban areas are better educated than the populations of rural areas.

Attendance levels for children aged 6-14 range from 16 percent in Niger to 88 percent in Colombia. The highest levels

are found for Latin America/Caribbean. In general, levels of male attendance exceed female levels, and there is little evidence that this gender gap has been narrowing substantially in recent years. Attendance rates are usually higher in urban areas than in rural areas.

Median numbers of years of schooling range from less than 1 full year in 11 countries, mostly in sub-Saharan Africa, to 10.6 years in Kazakhstan and at least 6 years in 13 other countries. Median years of education are highest in Latin America/Caribbean and lowest in sub-Saharan Africa.

Levels of educational attainment are generally higher for males than for females. The exceptions to this pattern are found mostly in Latin America/Caribbean. As with attendance levels, there is a considerable difference between attainment levels in rural areas and those in urban areas.

There is some evidence, by no means universal, that educational levels have been improving over time. In many countries, younger age groups show higher median years of education than do older age groups.

As the above results indicate, among the countries with DHS surveys, those of sub-Saharan Africa seem to have made the least educational progress, while those of Latin America and the Caribbean seem to have made the most educational progress. However, within each region there is a great deal of country-to-country variation.

1 Introduction

Education is a crucial factor in national social and economic development (Hill and King, 1993). It is essential to reduce poverty and to increase human capital and can be considered the most basic building block of development (UNICEF, 1995). A literate, well-educated labor force is essential if a country is to lay the foundations for sustainable economic development and to compete effectively in today's global market.

The proportion of the adult population that is literate is a good indicator of economic development. Recent World Bank data for some 71 low- and middle-income countries indicate a definite negative, somewhat *L*-shaped association between illiteracy rates and GNP per capita (Figure 1.1).

Education also represents an important investment for the individual (Hill and King, 1993). The higher one's education, the greater one's chances of benefiting from the economic opportunities and higher paying occupations that society offers. Education and the literacy skills derived from it allow individuals to obtain and make better use of information, leading to improved decision making. Education also helps mold lifestyles and facilitates independent critical thinking (UN, 1995).

Among the goals of the 1990 World Summit for Children for the year 2000 was "basic education for all children and completion of primary education by at least 80 percent—girls as well as boys" (UNICEF, 1996B). It is not yet certain which countries will meet this goal, but data for the early 1990s indicate that reaching it would be a monumental achievement for many. Figure 1.2 reveals that, for whole regions of the world, levels of literacy remain low, especially for females. The percent of children who reach the fifth grade (used by UNICEF to summarize the level of educational attainment in a country) stands at 75 percent for the developing world as a whole, ranging from 59 percent to 91 percent for the developing regions (Figure 1.3).

There has been progress, however, and levels of enrollment, which should translate into higher levels of attainment, have been rising. In virtually all regions of the world, enrollment increased, often dramatically, between 1980 and 1994 (Figure 1.4). Such enrollment numbers are influenced by overall population size, of course, but DHS data presented later in this report indicate that enrollment ratios (proportions enrolled) have risen as well.

This report provides detailed data on educational levels and differentials from recent Demographic and Health Surveys (DHS) in 39 countries. These data are presented against a backdrop of world and regional data from UNESCO and UNICEF.

1.1 MEASURING THE QUANTITY OF EDUCATION

In this report two measures of the *quantity* of education are examined: one measure is attendance (enrollment),¹ and the other measure is attainment (achievement)². Each can be defined in several ways; but for a given country at a given point in time, it is likely that all measures will point to the same general conclusion regarding the level of education in that country.

Measures of enrollment give evidence about the number of persons receiving education at a point in time, as well as about dropping out and continuing in school. They are also predictors of the future attainment levels of a population. They include:

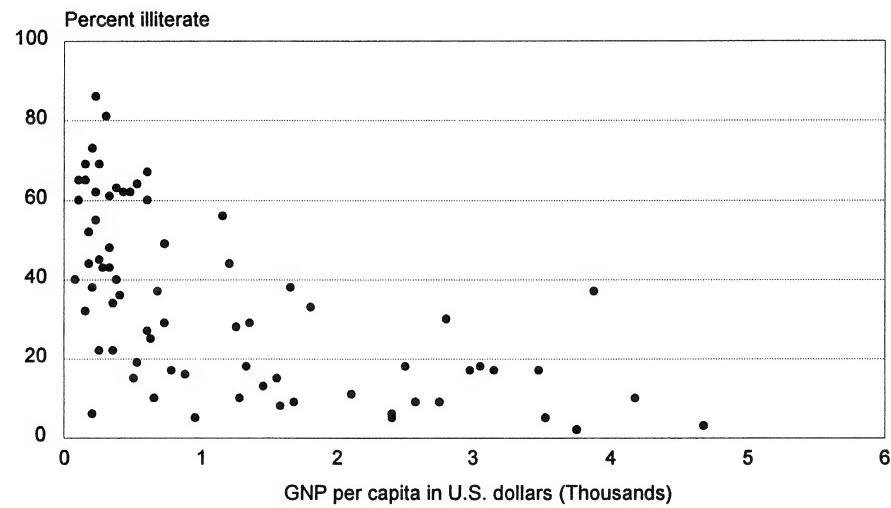

- *The Gross Enrollment Ratio.* The number of children of any age enrolled at a given level divided by the number of children of the appropriate age for that level. This measure can and does exceed 100 because some students are older or younger than the standard school ages.
- *The Net Enrollment Ratio.* The total number of children of the appropriate age enrolled at a given level, divided by the total number of children of that age.
- The percent of a given age group currently attending school regardless of level.
- *Completion Rates.* The percentage who are completing a given grade or level.
- *Dropout Rates.* The percentage who are not proceeding from one level to the next.
- *Continuation Rates.* The percentage who are proceeding from one grade or level to the next.

Measures of attainment can give information about another important topic: changes over time in level of education. In this study evidence about the current situation and the past is presented. Measures of attainment include literacy (however defined and measured) of individuals above a certain age and percent (usually of adults) who have completed a given year or

¹ Strictly speaking, enrollment refers to a child's name being "on the books," while attendance refers to a child's actual presence in a classroom. School records (e.g., what UNESCO data summarize) are more likely to give figures on enrollment, while survey responses (e.g., DHS data) are more likely to measure attendance.

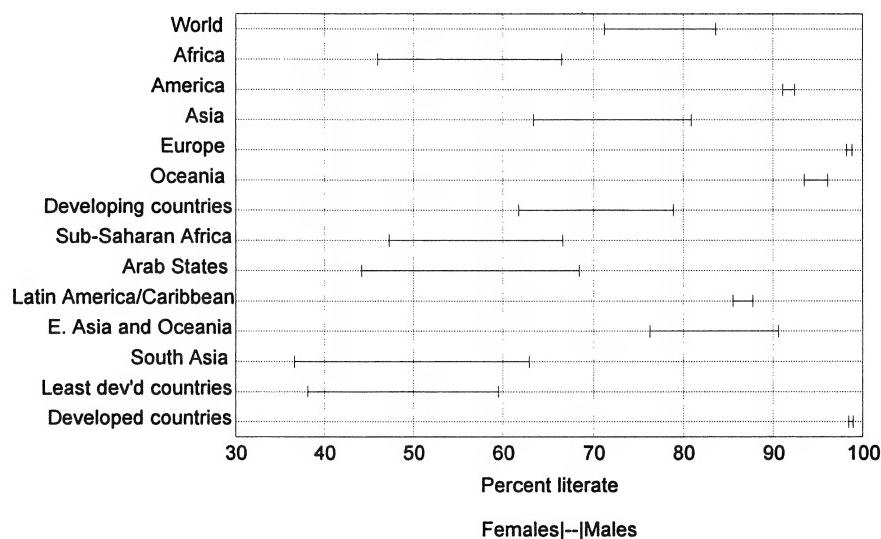

² The *quality* of education is discussed in Section 1.2.

level of schooling. Literacy may be measured by answers to a question on reading ability (as in the DHS surveys), or by a proxy, such as completion of a certain minimum number of years of schooling, such as 4. Information on literacy is useful for examining questions of access to information: The more literate an individual is, the more ability he or she has to use available information. On the other hand, years of schooling indicate how much in-school socialization an individual has had and what the individual knows or can do. As demonstrated below, however, a certain number of years of schooling does not guarantee literacy.

The level of schooling completed (as distinct from the number of years) has other implications: Employment is often conditional on the completion of a certain level (UN, 1995), regardless of the fact that the number of years required varies from country to country.

Comparisons of the educational attainment levels of different age groups are reflections of past levels of enrollment. Years of schooling of the adult population and its literacy level both reflect educational investments and achievements in the past but do not necessarily reflect what is currently happening (Hill and King, 1993).

1.2 MEASURES OF QUALITY OF EDUCATION

Measures of enrollment and attainment provide much information about the quantity of education being provided in a country. They do not, however, indicate the quality of that education: Whether children are learning and what they are learning.

There are several ways to measure quality. One measure is literacy; when individuals from different countries with the same number of years of education are examined, their literacy levels give some indication of the relative quality of education in those countries (UN, 1995). Literacy levels in countries with DHS surveys are examined in section 3.

Other measures of quality of education include government expenditures on education; pupil-teacher ratios; curriculum content; the actual abilities of teachers; the simple existence of seating places for students; the presence of textbooks; the presence of chalkboards; teaching in a language spoken at home; and whether schools do or do not have running water and toilets (UNICEF, 1996A, 1997).

Apart from information on literacy, DHS surveys do not speak to the issue of quality. However, data from other sources for the countries included in this study are discussed below to provide some indication of quality of education.

In the 1980s, spending per pupil in primary education fell in Africa and Latin America; for secondary education spending fell in all developing regions. In recent years, government spending

on education has been up sharply in some of the world's most populous developing countries. In Latin America during the past 5 years, there has been an average increase of 40 percent in government spending. Most of this increase comes from sources within the countries themselves: Only 2 percent of expenditures on primary education by low- and middle-income countries come from foreign aid (UNICEF, 1995, 1997). Plans at the international level are to increase funding further: UNICEF hopes to double its spending on basic education by the year 2000, and World Bank lending levels for basic education have been rising significantly during the 1990s (UNICEF, 1997).

Pupil-teacher ratios vary around the world. UNESCO data show that ratios are more than 30 pupils per teacher for the majority of the individual countries represented in this report (Figure 1.5).

The content of the curriculum and the relevance of that content to the needs of individuals and to the society are other indicators of the quality of education. A 1990 World Conference on Education for All stressed the need for flexible, diverse approaches (UNICEF, 1997). In many instances, much of traditional educational content may be irrelevant, and alternative approaches are being tried. In Ethiopia, village education centers are emphasizing childhood and adult education that is more appropriate to the village context and to local needs; the results may not be reflected in standard education statistics. In Brazil, India, Peru, the Philippines, and elsewhere, innovative schemes are reaching more children in new ways (UNICEF, 1997). In many countries, the goal is to provide education that is relevant and useful for children who may already be working or who will be working soon (UNICEF, 1995, 1997).

1.3 GENDER AND EQUAL ACCESS TO EDUCATION

The subject of gender differences in education is of great concern to educators around the world and is a major thread of interest throughout this report. Increases in educational opportunities and attainment for females are especially important both for individual women and for their societies. "Education...is one of the clearest examples of discrimination women suffer" and is "one of the most critical areas of empowerment for women, as both the Cairo and Beijing conferences affirmed" (UNICEF, 1996B, p. 71). Education can raise levels of self-esteem and give women more control over their lives (UN, 1995; UNICEF 1996A). For the individual woman, education can result in increased income. The productivity of women both in farm and nonfarm sectors is increased by education.

There is ample evidence that a woman's education is strongly related to her reproductive and health-related behavior. Results from DHS surveys consistently show that educated women have higher ages at marriage, use contraception more, and have fewer children than uneducated women do. Studies have

shown that an extra year of schooling for girls is associated with a reduction in fertility rates of 5 to 10 percent (UNICEF, 1996B). Better educated women also seem to be more effective at accessing professional medical assistance for themselves and for their children. Consequently, their children's chances of survival are greatly enhanced (UNICEF, 1996A, 1996B).

In most developing countries, lower proportions of girls than boys ever attend school, and the girls who do attend stay in school fewer years than the boys do. The result is that there are higher proportions of adult men than of adult women who are literate (Figure 1.2). Differences in current enrollment levels for boys and girls are equally apparent, with girls consistently making up less than 50 percent of total enrollment (Figure 1.6). For the developing countries of the world as a group, the percentage of students who are girls is highest (though still below 50 percent) in the primary level and drops through the secondary and tertiary levels (UN, 1995). Except for Latin America and the Caribbean, in no developing region of the world are girls in the majority at any level.

There are many factors that affect this gender gap in education. The more prominent factors are:

- *Economics.* The economic returns to a family for educating a daughter can be low, especially compared to having her work for the family. Market forces tend to limit the entry of women entirely or confine them to certain occupations. Women generally receive lower wages than men do. On the other hand, some observers argue that school may not pay off for boys, and many may leave to become apprentices and earn more money in trades and workshops (Tekçe et al., 1994).
- *Tradition.* Prevailing cultural norms often reinforce the idea that women should be confined to traditional roles and that sons, not daughters, should receive education because they are the ones who will support their own families and their parents (UNICEF, 1996A). Conforming to traditional roles usually implies deemphasizing education for females. Why provide girls with skills that will have little relevance for their lives? They should marry early, have less education than their husbands, and not learn "modern" ideas that may make them rebellious. Education for girls can be important in marriage negotiations (Tekçe et al., 1994).

Data presented later both from DHS and from other sources document that gender gap in education is quite obvious for the countries covered in this study. This gap, however, varies considerably from country to country and has been narrowing in many countries. (See also the discussion of education in Kishor and Neitzel, 1996.)

The traditional forces that produce higher male attendance levels were stronger in the past, and hence might be expected to

produce gender differences that are smaller for younger age groups. There is evidence that the gender gap in education is narrowing, but slowly. For 1965-1985, the disparity at the primary level fell considerably; the gap at the secondary level did not fall as much (Hill and King, 1993). In all regions of the world, increases in the total number of females enrolled between 1980 and 1994 were greater than the increases for males (Figure 1.7). Differences in increases were largest in Southern Asia and the Arab States; in most instances the differences were small.

There are numerous examples of programs designed to close the gender gap in education. In Bangladesh, Burkina Faso, rural south Egypt, Mali, Nepal, Pakistan, and Senegal, programs of various designs have all shown success (UNICEF, 1996A).

1.4 EDUCATIONAL SYSTEMS IN THE COUNTRIES UNDER STUDY

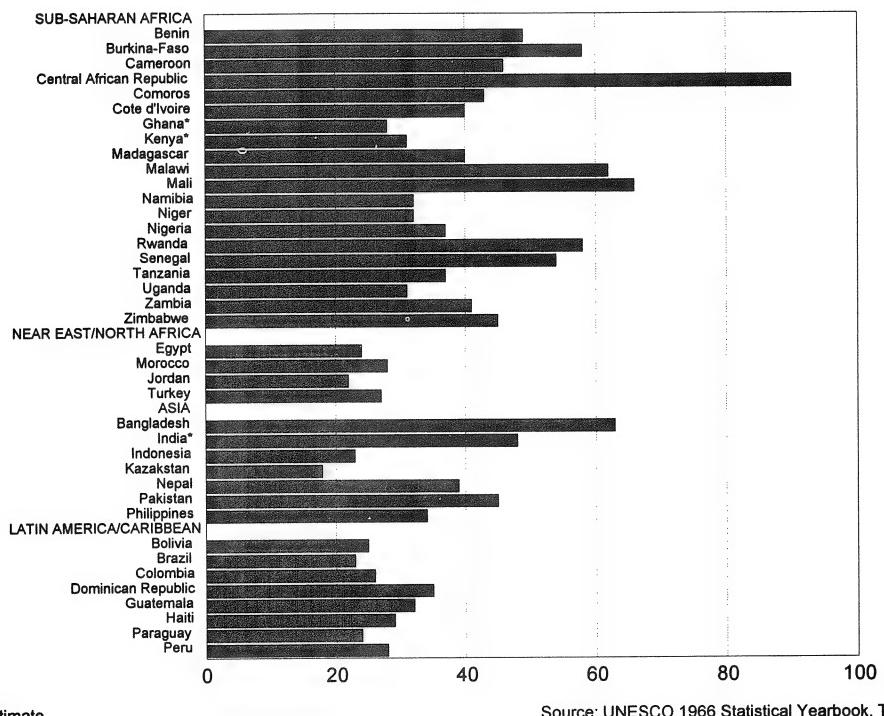

Educational systems vary significantly from country to country in the required age of entrance, the number of years that it takes to complete elementary and secondary levels, and the number of years of schooling that are mandatory. For the countries included in this study, the systems are summarized in Table 1.1. The number of years of compulsory education varies from as little as 5 years in Bangladesh, Colombia, Egypt, Madagascar, Nepal, and Turkey to as many as 11 years in Kazakhstan and Peru and 10 years in Jordan and Namibia. The number of years designated as primary education varies as well: between 4 years (Kazakhstan) and 5 years (Bangladesh, Colombia, Egypt, Madagascar, Pakistan, and Turkey) to 10 years (Jordan). Secondary education is equally diverse and can vary between 2 years (Jordan) and 7 years (15 countries).

1.5 DHS DATA ON EDUCATION

The DHS started collecting data on education for the de facto and de jure household populations during the second phase of the program (DHS-II). Typically, for every household member and every visitor who spent the night preceding the survey in the house and who was 5 or 6 years old or older³ the following question was asked: *Has (name of household member) ever been to school?* If the answer was affirmative, the respondent was then asked, *What is the highest level (name of household member) attended?* and *What is the highest grade (name of household member) completed at that level?* Additionally, for every household member older than 5 or 6 but less than 25 years, current school attendance was ascertained by asking: *Is (name of household member) still in school?* With this information it is possible to examine educational attainment, enrollment levels,

³ In general, these questions were asked of household members 5 or 6 years or older. Two exceptions were in Egypt and Morocco, where these questions were asked of the population 3 years or older and 7 years or older, respectively.

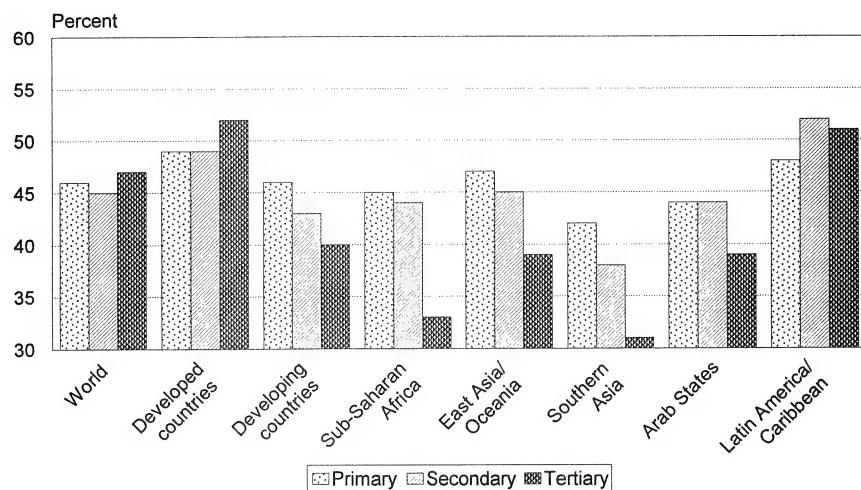

Figure 1.5 Pupil-teacher ratios, primary level, by country, early 1990s

* Estimate

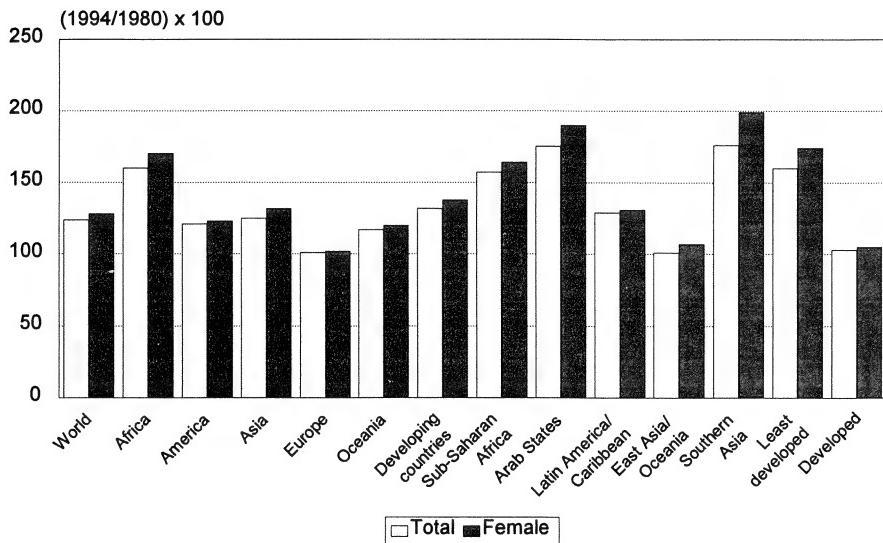

Source: UNESCO 1966 Statistical Yearbook, Table 3.4

Figure 1.6 Female enrollment as percent of total enrollment, by level and region, 1994

Source: UNESCO 1996 Statistical Yearbook, Table 2.5.

gender gaps and other gaps in enrollment, and continuation rates for representative samples of the total populations. In this report, tables based on household-level data are calculated for the de facto population.

In addition, eligible women ages 15-49 (either all women or ever-married women, depending on the country) with less than any secondary education were also asked about their literacy. Literacy was measured by asking all such women, *Can you read and understand a letter or a newspaper easily, with difficulty, or not at all?* In this report, data from women at the individual-level are based on the de facto population, that is, all women who slept in the household the night before the survey, whether they were the usual residents or visitors.

Countries in this report are grouped in the following regions: sub-Saharan Africa (with 20 countries), Near East/North Africa (4 countries), Asia (7 countries), and Latin America and the Caribbean (8 countries). The characteristics of these surveys are summarized in Table 1.2. With the exception of Brazil, all surveys are nationally representative.⁴ For most of the countries, the survey population included all women of reproductive age

(15-49). For several of the countries,⁵ however, the sample of women was restricted to those who had ever been married.

1.6 CONTENTS OF THIS REPORT

This report is divided into the introduction, two main sections, and a conclusion. Section 2 provides information on school attendance: enrollment ratios, attendance rates, and continuing in and dropping out of school. Section 3 deals with attainment: years and level of completed schooling and illiteracy and reading ability. Section 4 summarizes the main points of the discussion.

1.7 NOTE

The importance of education for individuals and for societies is not examined here. Instead, this study is limited to basic documentation of the levels of educational enrollment and attainment in 39 developing countries for which recent DHS survey data are available. While UNESCO and UNICEF annually provide summary information on education for most of the countries of the world, the DHS surveys allow more detailed tabulations of data on basic education measures and more intricate analyses relating education to other topics, such as fertility and mortality.

⁴ In Brazil, the survey was carried out in the Northeast region. The states that constitute the Northeast are: Alagoas, Bahia, Ceará, Maranhão, Paraíba, Pernambuco, Piauí, Rio Grande do Norte, and Sergipe.

⁵ These countries are Bangladesh, Egypt, India, Indonesia, Jordan, Nepal, Pakistan, and Turkey.

AW all women; EMW ever-married women.

Analyses using DHS data of the relationship of education to other variables can be found in earlier DHS publications (e.g., Bicego and Ahmad, 1996; Curtis and Neitzel, 1996; Ezech et al., 1996; Govindasamy et al., 1993; Kishor, 1997; Martín and Juárez, 1994; Muhuri et al., 1994; Sommerfelt and Stewart, 1994; Westoff and Bankole, 1995; Westoff et al., 1994; and individual country reports and comparative studies), as well as in non-DHS sources (e.g., Bhasin, 1994; Bhusan and Kincaid, 1995; Bicego and Boerma, 1993; Blanc and Lloyd, 1996; Bourne and Walker, 1991; Frankenberg and Mason, 1995; Hobcroft, 1996; Jejeebhoy, 1995; Jejeebhoy, 1996; King and Hill, 1993; Martín, 1995; Sathar, 1993; UN, 1995; UNESCAP, 1992; Vedder, 1994).

1.8 CONVENTIONS USED IN THIS REPORT

Medians. There are some occasions in the text in which unweighted country medians are cited. These are nothing more than the middle value of the country values for the relevant measure. For example, if the 3 countries in a region have attendance rates of 40 percent, 45 percent, and 50 percent, the unweighted median attendance rate for that region is 45 percent, regardless of the relative population sizes of the 3 countries.

Rounding. Numbers in the tables are rounded to the nearest whole number or decimal point that is being used. This can sometimes lead to apparent discrepancies. For example, in Appendix Table A3.1, in Burkina Faso, males have a median number of years of education of 0.6 and females of 0.6, and the difference between the two medians is shown as 0.1 years. In this case, males have a value somewhat greater than 0.6 and females have a value somewhat less. Both round to 0.6, but the difference is greater than 0.05 and hence rounds to 0.1. Rounding can also lead to situations where percentage distributions do not sum to 100.0 percent.

Level of development. It may be of interest to have a general ranking of the level of human development of the countries for which data are presented. Appendix Table A1.1 shows the human development indexes for each country, as developed and reported by the United Nations in its 1995 Human Development Report (UNDP, 1995).

2 Attendance

In this section enrollment and attendance data are presented. UNESCO data on enrollment ratios in regions of the world provide a backdrop for more detailed information from the DHS on current attendance, falling behind, continuation rates, and reasons for dropping out.

2.1 ENROLLMENT RATIOS

To provide some perspective before DHS data on attendance in individual countries are presented, regional data from other sources are useful. The regional gross enrollment ratios⁶ shown in Figure 2.1 illustrate the following themes:

- There are significant differences in enrollment among the regions of the world. Ratios range from a high of almost 120 for males at the first level of education in East Asia and the Pacific to lows of near 0 for the third level of education, again in East Asia and in the Pacific.
- In all regions enrollment ratios are highest at the first (primary) level, next highest at the second (secondary) level, and lowest at the third (tertiary or college) level. The differences tend to be more dramatic in low-income regions.
- Enrollment ratios are generally higher for males than for females at the primary and secondary levels. Exceptions are found in the high-income countries and in Europe/Central Asia.

Other data not shown, indicate general, but not universal, improvements in enrollment ratios over time, as well as improvements in gender ratios (UNICEF, 1996B).

2.2 CURRENT ATTENDANCE RATES

For the total population aged 6-14, current attendance rates⁷ for the 39 countries included in this study vary considerably, from a low of 16 percent in Niger to a high of 88 percent in Colombia (Figure 2.2). By regions, the unweighted country median percentages are highest in Latin America and the Caribbean (76 percent), followed by the Near East and North Africa (75 percent), Asia (70 percent), and sub-Saharan Africa (56 percent). Sub-Saharan Africa shows the greatest within-region variation: 2 countries (Namibia and Zimbabwe) have more than 80 percent attendance levels, while 4 countries (Burkina Faso, Mali, Niger, and Senegal) have levels below 40 percent.

⁶ The number of children of any age enrolled at a given level divided by the number of children of the appropriate age for that level.

⁷ Unlike gross enrollment ratios, attendance rates calculate percent of a given age attending school regardless of grade.

Patterns of school attendance by age are not consistent (Appendix Table A2.1). Attendance levels for ages 8-9 are always higher than for ages 6-7, undoubtedly a function of first grade starting at age 7 and/or children starting the first grade late (age appropriateness for the primary grades is discussed in section 2.4). One might expect attendance rates to fall with increasing age, but this is not always the case. Only 7 countries show patterns of consistent declines beginning at ages 8-9. The highest attendance rates are usually found for ages 8-9 or 10-11, but for 8 countries the highest attendance rates are found at ages 12-14.

Age patterns of attendance are not always the same for males and for females. For example, in some cases (Comoros and Malawi) the highest attendance level is at different ages for males and for females.

Gender differences in levels of attendance are measured in two ways in Appendix Table A2.1. The first way—the ratio of female attendance rates to male attendance rates—shows that female levels are greater than male levels in 8 of the 39 countries, although sometimes by very little (Figure 2.3). Almost one-half of the countries (19) show ratios near equality (between 95 and 105). The highest ratio is found in Brazil (119) and the lowest ratio in Niger (58).

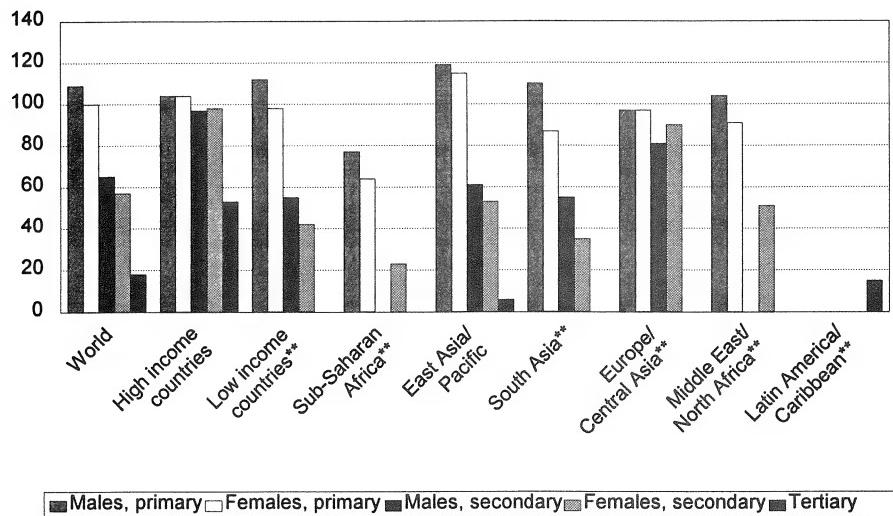

If gender differences in attendance have lessened in recent years, then female/male ratios of attendance rates would be lower for older ages. Instead, consistent patterns of ratios that decline with increasing age are only found in 13 countries, although in numerous other countries some evidence of this pattern is found.

The second way of measuring gender differentials in attendance—absolute differences in percentage point attendance levels—tells essentially the same story. Differences are less than 5 for 20 of the 39 countries. In only 2 countries (Brazil NE and the Dominican Republic) are female levels higher than male levels by more than 5 percentage points. Eight countries show male advantages greater than 10 percentage points, with the highest being Benin at 21. In 14 countries absolute differences rise consistently with age.

2.3 RURAL-URBAN DIFFERENCES IN ATTENDANCE

Rates of attendance vary substantially between rural areas and urban areas among the countries under review (Figure 2.4). Reflecting urban biases in the allocation of education funds and personnel as well as different demands on children's time and efforts and different parental assessments of the returns to education, school attendance levels in rural areas are usually lower than those in urban areas. In only 4 countries of the 38

Figure 2.4 School attendance of household population aged 6-14 by rural-urban residence

Source: Appendix Table A2.2.

countries⁸ studied (Bangladesh, Kazakhstan, Kenya, and Namibia) are rural attendance levels higher than urban levels, and in each of these cases the difference is trivial. In only 6 countries are more than 80 percent of rural children attending school. Extremely low levels of attendance (less than 20 percent) in rural areas are found in Burkina Faso, Mali, Niger, and Senegal.

The unweighted country median ratio of rural-to-urban attendance levels is 77 percent; that is, for the 38 countries, the middle value for the ratio of rural attendance percentages for children ages 6-14 to urban attendance percentages is 77 percent. Medians are in the 80s in Asia (87), Latin America/Caribbean (86), and the Near East/North Africa (84), while they are much lower in sub-Saharan Africa (71).

In 11 countries, rural-urban ratios of attendance rates are higher for females than for males (Appendix Table A2.2). With the exception of Northeast Brazil, however, the female advantage in this direction is under 10 percent, while the advantage that exists in some countries for males is often much larger. In Niger, the most extreme case, the rural-urban attendance ratio for females is only 52 percent that of males.

2.4 FALLING BEHIND

Attendance rates by themselves do not necessarily reflect the successful passage of students through the school system. As the data on gross enrollment ratios show, there may be more students enrolled at a given level of schooling than there are children of the age appropriate for that level.

Another perspective on attendance is achieved by calculating behind grade ratios. In behind grade ratios, the denominator is the total number of children in a given grade. The numerator is the number of children who are behind grade. *Behind grade* is defined here as being more than 2 years older than the appropriate age for a grade (with appropriate age calculated using the age-to-grade specifications given in Table 1.1). For example, in a country where the entering age for the first grade is 6, first graders of the appropriate age will be either 6 or 7. Anyone in the first grade who is age 10 or older is classified as behind grade. This is a very conservative approach, so the figures should be interpreted as lower bound estimates of the incidence of being behind grade.⁹

For grades 1-6 taken as a group, the percentages of behind-grade students at the time of the DHS surveys in the 39 countries

studied range widely, from lows near 0 (Egypt, Indonesia, Jordan, and Kazakhstan) to highs of more than 50 percent (Central African Republic, Comoros, Haiti, Malawi, and Uganda) (Figure 2.5). Among the regions, Near East/North Africa has by far the lowest ratios, with a regional unweighted country median of just over 4 percent. The 39-country median is 20 percent, with medians of 10 percent for Asia, 22 percent for Latin America/Caribbean, and 28 percent for sub-Saharan Africa.

Only 8 countries show a behind-grade ratio that rises consistently for higher grades; no countries show a consistent fall. There is no country¹⁰ in which female behind-grade ratios for grades 1-6 are as high as male ratios, although in some countries female ratios are higher than male ratios in some grades (Appendix Table A2.3). Higher male behind-grade ratios are not inconsistent with higher male attendance rates. Both indicate that males are usually favored when it comes to education: Higher percentages of males attend school, and males may tend to persist in hopes of eventually obtaining an education.¹¹

2.5 CONTINUING ON FROM LEVEL TO LEVEL

Some students drop out of school (see section 2.7 for data on reasons for dropping out). Other students continue on. DHS data enable the calculation of two types of continuation rates: school-level continuation rates and school-grade continuation rates.

School-level continuation rates are retrospective, referring to periods of a varying number of years in the past. Three continuation rates have been calculated for three age groups and all persons age 15-49: the primary graduation rate, the secondary entrance rate, and the secondary graduation rate (Appendix Table A2.4). The *primary graduation rate* for a given age group is defined as the percentage of those who had completed primary school, among all those who had at least started primary school. The *secondary entrance rate* is defined as the percentage of those with at least some secondary school, among all those who had completed primary school. Finally, the *secondary graduation rate* is defined as the percentage of those who had completed secondary school, among all those who had at least started secondary school.

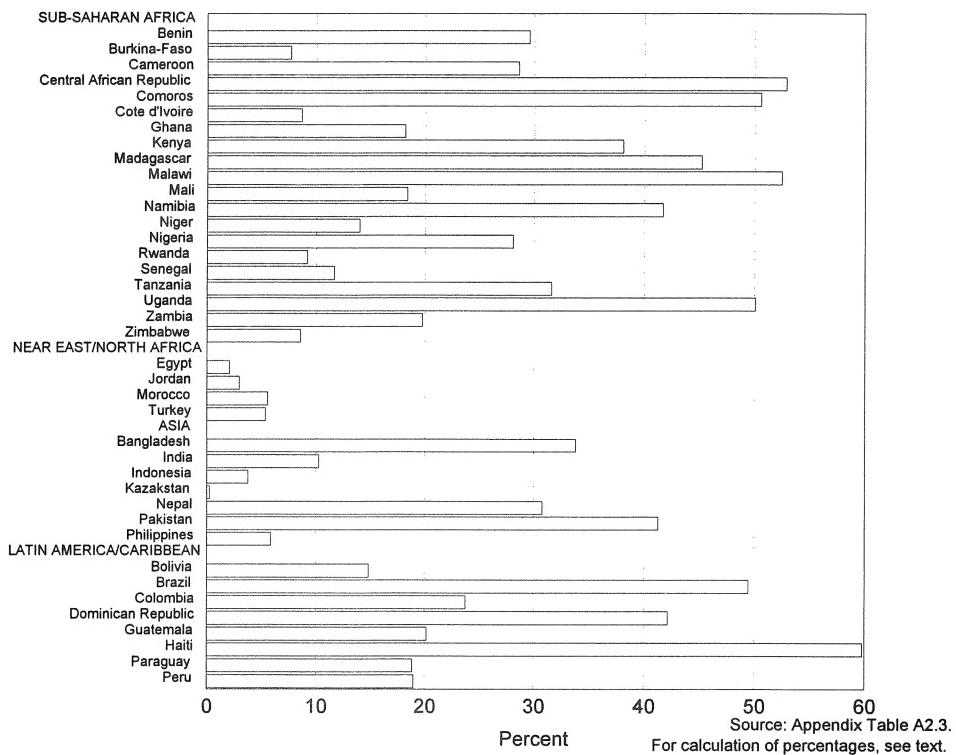

⁸ Malawi data on rural-urban differences were not yet available when this report was being written.

⁹ Age misreporting can also affect the patterns here (and elsewhere). For example, if children who are age 9 have a tendency to be reported as age 10 (age heaping), then any measure that counts 9- or 10-year-olds will be biased.

¹⁰ Except Kazakhstan, where the numbers were too small to consider.

¹¹ Other factors may also be present, making it difficult to untangle the web of causality. For example, selection may be at work: Girls who attend school at all may be from households that are committed to education; such girls may be more likely to continue in school. Parents who have trouble paying for their sons' education may take them out and put them back into school repeatedly, while daughters may simply be pulled out permanently. As with all factors, these considerations will be different for different cultures and different countries.

Figure 2.5 Behind-grade pupils as a percentage of total number of pupils, grades 1-6

Among the regions, the highest median continuation rates for all three transitions are found in Near East/North Africa (Figure 2.6). Asia ranks second for primary graduation rates, while Latin America/Caribbean ranks second for secondary entrance rates and secondary graduation rates. Continuation rates for sub-Saharan Africa are generally the lowest or close to the lowest.

Primary graduation rates over 80 percent are found in 9 countries, which are Ghana, India, Jordan, Kazakhstan, Nigeria, Pakistan, Peru, the Philippines, and Turkey (Figure 2.7). At the other extreme, primary graduation rates below 40 percent are found in 6 countries, which are Brazil, Central African Republic, Malawi, Niger, Rwanda, and Tanzania.

In the regions of sub-Saharan Africa and Latin America/Caribbean, secondary entrance rates tend to be higher than primary graduation rates. This is true as well in 22 individual countries (Appendix Table A2.4). This can be at least partially explained by noticing that primary graduation rates require continuation in school over a number of years, while secondary entrance rates require only that a pupil move on to the next grade, which happens to be at a different level.

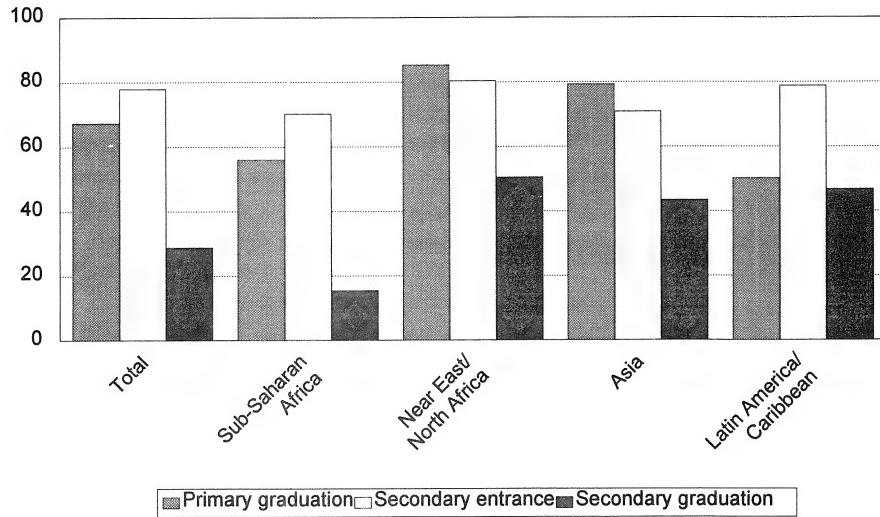

Median secondary entrance rates tend to be considerably above median rates for secondary graduation in all regions; the same reasoning is applicable here, as well as the fact that the younger respondents have not yet had time to finish secondary school. The gap is especially wide in sub-Saharan Africa. No country has secondary graduation rates above 80 percent, but 8

countries (Bolivia, the Dominican Republic, Egypt, India, Kazakhstan, Nigeria, Peru, and the Philippines) have rates above 60 percent.

Generally, regional unweighted median continuation rates are higher for males than for females but, except for sub-Saharan Africa, the female rates are usually above 90 percent of the male rates. Primary graduation rates are equal or higher for females than for males in 6 countries, secondary entrance rates are higher for females in 8 countries (one-half in Latin America/Caribbean), and secondary graduation rates are higher for females in 7 countries (3 countries in Asia). Female-to-male ratios for all three transitions below 90 percent are found chiefly in sub-Saharan Africa.

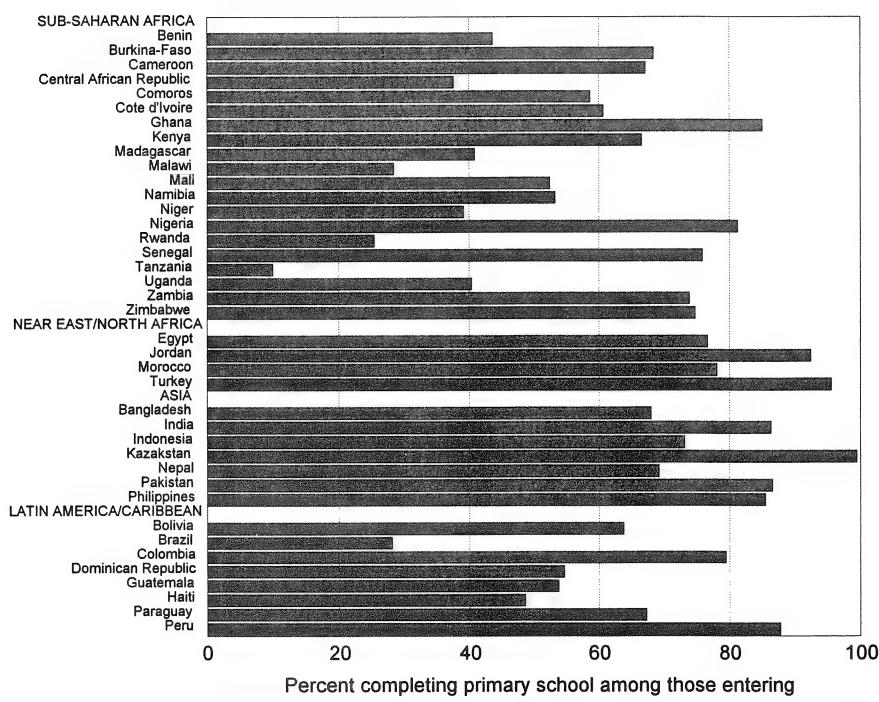

If educational systems have improved over time, then one would expect to find higher continuation rates for younger cohorts than for older ones. Such a pattern is found, however, for only 17 of 39 countries for primary graduation rates, for 21 countries for secondary entrance rates, and for no countries for secondary graduation rates (Appendix Table A2.4). The exact opposite pattern, that is, higher continuation rates for older cohorts, is found for 4 countries for the first transition, 6 countries for the second transition, and 26 countries for secondary graduation rates, or the third transition. These findings may indicate some deterioration in educational systems, although, or the last finding is presumably influenced by the fact that the younger cohorts, especially those age 15-24, may not have completed their schooling.

Source: Appendix Table A2.4.
See source table for definition of rates.

2.6 CONTINUING ON FROM GRADE TO GRADE

A perspective on more recent rates of school-level continuation is presented by school-grade continuation rates, which can be calculated for the transition between any two grades. For example, for the transition from second to third grade, the denominator is all those children of appropriate age who could currently be in third grade (in a system where 6 years is the appropriate age for entering first grade), that is, all those children age 8-9 years whose last successfully completed grade was the second grade. The numerator is all those among the denominator children who are still attending school, that is, who are actually currently in the third grade.¹²

Data from DHS indicate that, in the primary grades, high proportions of both boys and girls continue from one grade to the next (Table 2.1). In all regions, median continuation rates are well over 90 percent for the transitions from second to third grade, fourth to fifth grade, and sixth to seventh grade. The rates for continuing from sixth to seventh grade are slightly lower than the rates for the other two transitions. Selection is probably at work in keeping these rates high: Making it through previous grades is undoubtedly related to a propensity and ability to keep going.

For the transition from second to third grade, only 2 individual countries (Guatemala and Niger) have rates (barely) below 90 percent. For the fourth to fifth transition, only 1 country (Rwanda) has a rate below 90 percent. Lower continuation rates are much more apparent, however, for the transition from sixth to seventh grade, which for 18 of the countries marks the change from primary to secondary levels. Nine countries show sixth-to-seventh continuation rates below 90 percent, with Senegal having the lowest rate at 57 percent. Of these 9 countries, all but 1 (Rwanda) are countries that had 6 years of primary schooling, where completion of the sixth grade means completion of a school level.

For school-grade transition rates, no substantial differences between boys and girls are apparent. Only for the transition from sixth to seventh grade are median female/male ratios for continuation rates any distance below 100 percent, with the lowest rates, 96, seen in Latin America/Caribbean. All regional median female/male ratios for the second-to-third grade transition are above 100 except for Latin America/Caribbean.

Among the 39 countries, 23 countries show female/male ratios for second-to-third grade continuation rates greater than

¹² These rates are probably maximum estimates of continuation. They include only children who are in the appropriate grade for their age. Presumably, children who are behind grade (and thus not in the appropriate grade) would be much less likely to continue from one grade to the next.

100, with the highest rate being 107. For the fourth to fifth transition, females have higher rates than males do in 16 countries, with no ratio going above 105. Fewer countries yet—only 8—show female rates greater than male rates for the sixth-to-seventh grade transition. (Small cell sizes mean that some countries are not included in some of these comparisons.)

2.7 REASONS FOR LEAVING SCHOOL

DHS surveys collected information on reasons for leaving school in 13 of the 39 countries. The question *What was the main reason you stopped attending school?* was asked only of women age 24 or below who were not currently attending school. Ten answers were pre-coded, and there was an “other” category. Results are displayed for two groups: Those who had attended only primary school and those who had advanced further (Table 2.2).

Pregnancy and getting married, in whichever order, could be expected to be important reasons for stopping school, especially secondary school.¹³ However, getting pregnant (column 1) is not a major reason for stopping school in most of the countries for which there are data. In only 2 countries (Central African Republic and Egypt) do more than 10 percent of all respondents say they left school because they got pregnant; for leaving secondary school or above, figures are more than 10 percent for 5 countries. In only 1 country—the Central African Republic—is getting pregnant the most cited reason for stopping secondary school.

Getting married (column 2) is more important than pregnancy as a reason for stopping school in 9 of the 13 countries. Getting married is usually of greater importance among those who discontinued school in the secondary grades, as is the case with pregnancy. In 5 countries more than one-fifth of those who leave secondary school cite marriage as the reason, with a high of more than 60 percent giving this reason in Nepal. At the other extreme, well under 10 percent of those who leave secondary school cite marriage as the reason in 5 countries. In only 2 countries—Indonesia and Nepal—is marriage an important reason (more than 10 percent) for stopping primary school.

Helping-the-family reasons for stopping school include taking care of children (column 3) and “Family needed help on farm or in business” (column 4) (also the need to earn money, which is discussed below). Taking care of children does not

¹³ As noted above, among the countries in the table, only ever-married women were included in the DHS sample in Egypt, Indonesia, and Nepal. Ever-married women are likely to have a different distribution of reasons for leaving school than never-married women. For example, never-married women will not report “getting married” as a reason for leaving school. The data must be interpreted in this light.

Table 2.1 Continuation rates by grade

School-grade continuation rates, by sex

Region and country	Total	Male	Female	Grade 2 to Grade 3				Grade 4 to Grade 5				Grade 6 to Grade 7

* Data not shown because based upon fewer than 25 unweighted cases.

Figures in parentheses based upon 25–49 unweighted cases.

Continuation rates calculated as follows: The denominator is all those children of the appropriate age for a grade (as defined in Table 1.1) who have completed that grade. The numerator is all those children among those in the denominator who are still in school. For example, in a school system where children enter first grade at age 6, children who are appropriate ages for grade three are aged 8 and 9. For the continuation ratio from second grade to third grade, the denominator is all children aged 8 and 9 who have completed grade two. The numerator is all the children among the denominator who are still in school.

Table 2.2 Reasons for leaving school

Percentage distribution of women 15-24 who have attended school but who are not currently attending, by reasons for leaving school, according to the highest level of attendance

* Reasons: 1 - Got pregnant 2 - Got married 3 - Take care of children 4 - Family needs help 5 - Could not pay school 6 - Need to earn money 7 - Graduated, enough 8 - Did not pass exams
 9 - Did not like school 10 - School not accessible 11 - Other 12 - Don't know/Missing

figure prominently in the responses in any country, but family needs are relatively important in 5 countries. In Bolivia, and Nepal, in particular, high percentages of those who left school in the primary grades say they did so to help on the family farm or in the family business.

Monetary reasons for stopping school include an inability to pay for school fees or necessities (column 5) and the need to earn money (column 6). Costs of schooling are cited by at least 30 percent of women as the reason for stopping school in Uganda, Zimbabwe, Indonesia, and Colombia; in other countries they are much less important. On the other hand, the need to earn money is cited by 1 in 3 women as a reason for stopping school in Egypt and Kazakhstan.

In most countries the percentages of individuals who have left school who cite graduation (column 7) as a reason for stopping school are low. Only Colombia, Egypt, and Guatemala show more than 10 percent of individuals stating that graduation was a reason for stopping either primary or secondary levels of education.

One reason for not graduating is not passing exams (column 8), which is a separate option on the questionnaire. In 5 countries, 4 of them in sub-Saharan Africa, not passing exams is a

prominent reason for stopping school. Outside of this region, only Egypt shows substantial percentages of individuals who stop school because of failing exams.

Simply not liking school (column 9) is a relatively important reason for stopping school in 7 countries, all in sub-Saharan Africa or Latin America/Caribbean. In 5 countries, almost one-third or more of those who had left primary school gave this as a reason. What those who leave school do not like about school is not known. Accessibility of school (column 10) does not seem to be a problem that causes individuals to stop school.

The residual “other” category of reasons for stopping school (column 11) is of some importance in several countries. Details about what other includes are not available.

In general, several reasons for leaving school stand out. “Could not pay for school” is the most important reason for leaving primary and secondary grades, and is the overall reason in 4 of the 13 countries. “Did not like school” is most important for leaving primary grades in 4 countries. In addition, “Got married,” “Needed to earn money,” and “Did not pass exams” are leading causes of departure in 3 or 4 countries. However, in the remaining countries, these reasons are insignificant.

3 Attainment

Questions about educational attainment are generally asked of individuals who can be expected already to have completed at least some schooling. To minimize problems associated with some individuals still being in school, data on years of schooling are presented here only for individuals age 15 and above at the time of the survey. In this section several measures of educational attainment are discussed: years of schooling, level of schooling, and literacy and reading ability.

3.1 YEARS OF SCHOOLING

The percentages of the population age 15 and above with less than 1 complete year of education are shown in Table 3.1.¹⁴ The regions with the highest unweighted country median percent with less than 1 complete year are sub-Saharan Africa and Asia (about 47 percent), followed by Near East/North Africa (29 percent) and Latin America/Caribbean (15 percent). In 8 countries (5 countries in sub-Saharan Africa, 1 country in Near East/North Africa, and 2 countries in Asia) more than 60 percent of the adult population have less than 1 complete year of education. On the other hand, in 10 countries (2 countries in sub-Saharan Africa, 3 countries in Asia, and 5 countries in Latin America/Caribbean), less than 20 percent of the adult population have less than 1 complete year of schooling.

The country with the highest percentage of its population age 15 and above with less than 1 year of education is Niger (88 percent), followed by Burkina Faso (83 percent) and Mali (81 percent). Kazakstan (3 percent), the Philippines (4 percent), and Paraguay (6 percent) stand out as the countries with the lowest percentages of their adult populations with less than 1 year of education.

The completion of at least 4 years of education can be used as a proxy for literacy. At the one extreme, 14 countries out of 39 countries have at least 60 percent of their adult populations meeting this criterion. At the other extreme, 3 countries, all in sub-Saharan Africa (Burkina Faso, Mali, and Niger), have less than 20 percent of the adult population with at least 4 completed years of education.

A measure of greater educational attainment is the percent of the population with at least 10 completed years of education. One country stands out with a high percentage of its population

age 15 and above having at least 10 years of schooling: Kazakstan, with 67 percent. In 3 other countries at least 40 percent have completed 10+ years of education: Peru (44 percent), the Philippines (42 percent), and Jordan (40 percent). In 16 countries (14 countries in sub-Saharan Africa, and Bangladesh and Nepal), on the other hand, less than 10 percent of the adult population have completed 10+ years of education.

The median number of years of schooling is perhaps the most convenient summary of educational attainment (Figure 3.1). By this measure, educational attainment is highest in Latin America/Caribbean (a median of 6.2 years), followed by the Near East/North Africa (5.8 years), Asia (3.2 years), and sub-Saharan Africa (2.9 years). As far as individual countries are concerned, Kazakstan (10.6 years) and Jordan (9.3 years) have the highest medians, while 11 countries (8 countries in sub-Saharan Africa, 2 countries in Asia, and 1 country in the Near East/North Africa) have medians below 1 full year.

Median years of education by sex are found in Appendix Table A3.1. Figure 3.2 illustrates that there are several different combinations of educational attainment and gender differences: Countries where educational attainment is low and about equal for both genders (e.g., Burkina Faso and Niger); countries where educational attainment is high and about equal for both genders (e.g., Kazakstan and the Philippines); countries where educational attainment is relatively low but substantially higher for males than for females (e.g., Nepal and Pakistan); and countries where educational attainment is high, especially for males (e.g., Egypt). Countries with medium levels of educational attainment can also have either small gender differences (e.g., Namibia and Turkey) or large gender differences (e.g., India). These patterns undoubtedly reflect both conscious government planning and cultural forces and may have implications for a country's economic development.

Gender differences in median number of years of education range from more than 5 in favor of males in Ghana and India to under 1 year in favor of females in Brazil, Colombia, the Dominican Republic, and Namibia. Latin America and the Caribbean seems to have the most gender equality in education: The other 3 regions all contain countries with gender differences of more than 4 years in favor of males.

Ratios of female-to-male medians present another perspective on gender differences in education. In 11 countries, the median number of years of education for females is less than 40 percent that of males. On the other hand, in 19 countries the female median number of years of education is at least 80 percent of the male median or even greater than the male number.

¹⁴ In this table, "no schooling" includes both those who never attended school and those who attended school but never completed first grade. In contrast, tables in section 3.2, level of schooling, have the category "none," which includes those who never attended school but which does not include those who attended school but did not complete first grade.

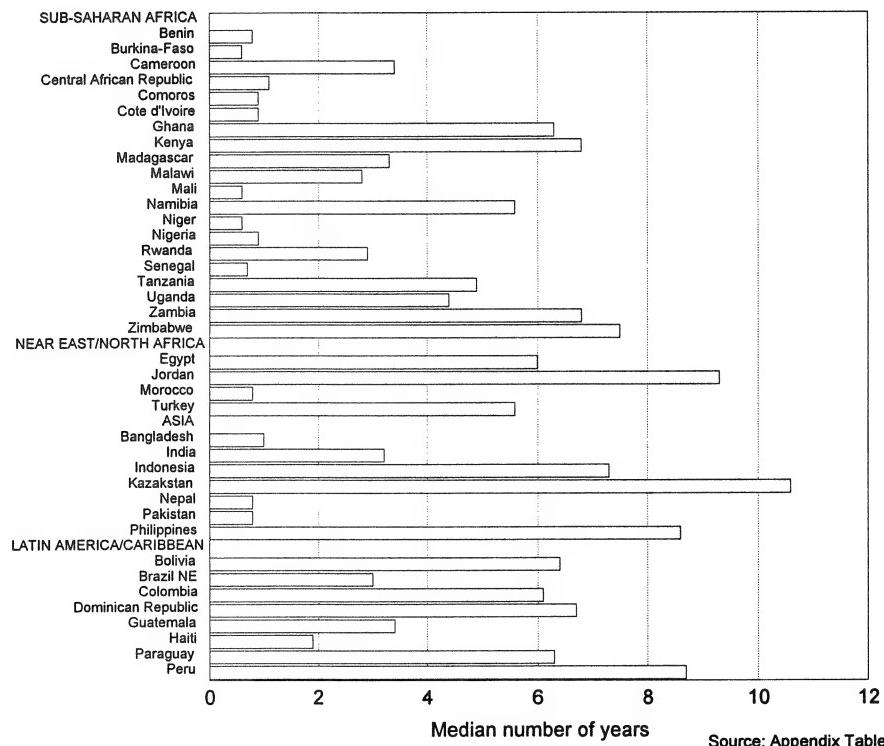

Table 3.1 Educational attainment: years of schooling

Percentage distribution of population 15+, by number of years of schooling

* “0 years” means less than one complete year.

Figure 3.1 Median number of years of education

Source: Appendix Table A3.1.

Figure 3.2 Male and female median number of years of education

Source: Appendix Table A3.1.

Data on educational attainment by age can be interpreted as a look at changes over time (Appendix Table A3.1). Levels of attainment at different times in the past can be compared by looking at current differences by age.¹⁵ For example, at a point in time, the median number of years of education for people age 40-44 represents the impact and effectiveness of the educational system 10 years earlier than does the median number of years of education for people age 30-34.

One may expect that educational systems in the countries in this study have been improving over time. To the degree that this hypothesis is correct, median years of education should be lower for older people, as should percentages with 4 or more years of education and percentages with 10 or more years of education. Percentages with less than 1 year of completed education, on the other hand, should be higher for older people.

To a large extent this expectation is borne out by the data. Almost every country shows values for median number of years of education (males plus females taken together) that decline, although sometimes irregularly, with age. The same is true for percentages of populations with 4 or more years of education. However, especially in sub-Saharan Africa, there are numerous instances where percentages with 10 or more years of education rise with age. These occur at different ages for different countries, but they are in general restricted to ages under 40.

Zambia presents an interesting example. For people age 20-24 in Zambia, 11.5 percent have at least 10 years of education. For people age 25-29, the number is 14.0 percent. The number is higher still—14.2 percent—for people age 30-34 and yet higher—15.7 percent—for people age 35-39. Even for people age 40-44, the percentage of individuals with at least 10 years of education is greater, at 12.5 percent, than it is for people age 20-24.

It might be argued, then, that some Zambians age 20-24 have not yet completed their education, so this cohort might eventually achieve a higher percentage in the future. This argument, in fact, applies strongly to percentages for age 15-19, which are always lower than percentages for age 20-24. However, it is highly unlikely that in Zambia the educational process continues well into the 40s. There must be a different explanation for this deviation, and other deviations, from the expected pattern.

¹⁵ Such an interpretation of data on current educational attainment status by age does not take into consideration the educational attainment of those who have out-migrated or who have died. Little data are available on these individuals. Comparisons can give valid estimates of educational changes over time if the mortality and migration experience of each age group is similar and if mortality and migration are not differentially related to educational attainment in the age groups being compared.

Two likely explanations for Zambia's percentages are (1) misreporting and (2) a deterioration (or at least a change of emphasis) within the educational system for some period of years in the past. Corroborating this surmise can be sought in patterns of percentages with less than 1 complete year of education: If the educational system deteriorated at some period in the past, then such percentages should be lower for older ages. However, except for Zambia, there are almost no instances of percentages of individuals with less than a year's education falling with age.

It is also possible that changes in emphasis within an educational system toward the earlier grades result, as time passes, in falling percentages with no education. This can happen at the same time as percentages with 10 or more years of education are falling.

The data show there are many more instances of age/time patterns not fitting the expected pattern for percentages with at least 10 years of education than for percentages with at least 4 years of education or for the median. It seems that the provision and attainment of higher levels of education are more uncertain and subject to societal changes.¹⁶

Gender differences in changes over time can also be observed (Appendix Table A3.1). If such differences had been decreasing, then one would see measures of gender differences that are more favorable for younger females than for older females.

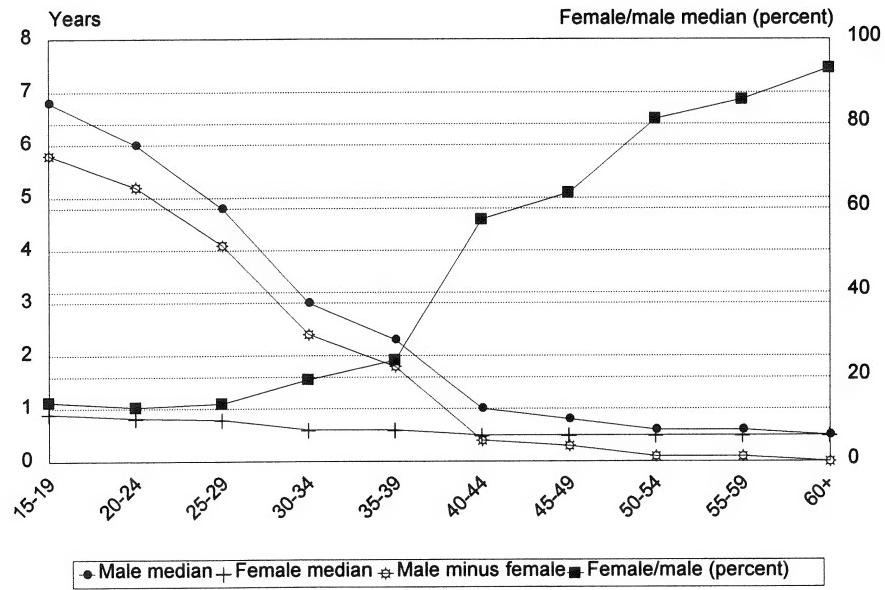

Data from Nepal illustrate changes in gender differences in median years of education (Figure 3.3). Both male and female medians are low (1 year or below) for the past (i.e., for individuals age 40 and above at the time of the survey). More recently (for younger age groups), the male medians have risen rapidly to almost 7 years, while the female medians have risen only slightly. As a result, the absolute difference in medians has risen dramatically among younger age groups, while the ratio of female-to-male medians has fallen substantially. At least in Nepal, improvements in education have mainly benefited males, resulting in increasing gender differentials.

Many other patterns are found among the 39 countries. For example, in Malawi, the male median peaked for age 30-34 and has fallen for younger ages (Figure 3.4). On the other hand, the female median began rising at ages younger than 30-34. The result is a rapid fall in absolute differences in medians and a rapid rise in the ratio of female-to-male medians at the younger ages.

Jordan represents another case of increasing gender equality in education. At ages below 45-49, there is a steady rise in the median for both genders. The female median rises more rapidly,

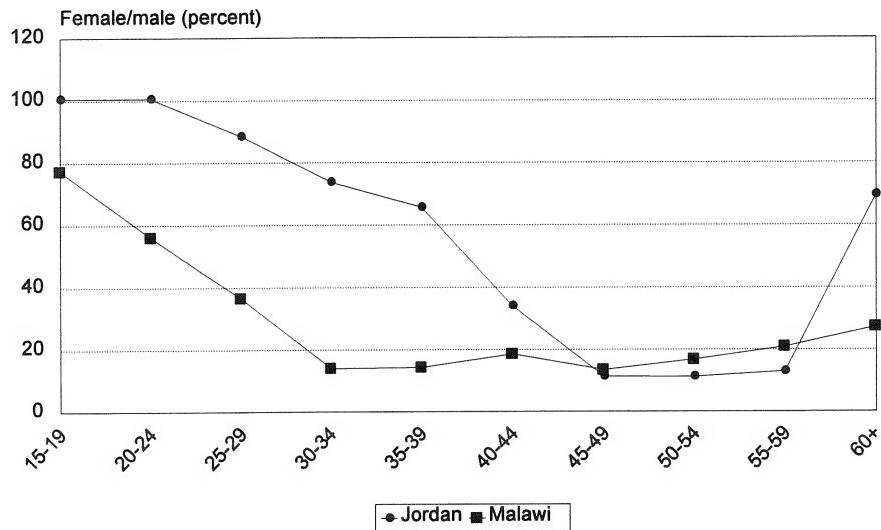

¹⁶ In addition, small sample sizes mean that the numbers are subject to larger sampling errors.

Figure 3.3 Sex differences in education in Nepal, by age

Source: Appendix Table A3.1.

Figure 3.4 Female-male ratios of median years of education, by age, Jordan and Malawi

Source: Appendix Table A3.1.

however, with the result that absolute differences in median years of education have essentially disappeared and the ratio of female-to-male medians has reached unity.

Numerous countries show some more or less consistent patterns of increasing gender equality in recent years (regardless of absolute level). Other countries show patterns of increasing gender inequality in recent years, including Benin, Burkina Faso, Niger, Senegal, and Turkey.

3.2 LEVEL OF SCHOOLING

Because there is a broad correspondence between measures of years of schooling completed and measures of levels of schooling completed, a detailed examination of level of schooling is not presented here. The fact that primary and secondary levels comprise a different number of years in different countries makes the interpretation of data on levels shown in Appendix Table A3.2 somewhat difficult. Among the 39 countries listed in Table 1.1, there are 14 different combinations of varying numbers of years of primary and secondary levels, even disregarding the fact that some educational systems distinguish a first stage and a second stage to the secondary level. The most common educational system is 6 years of primary, followed by 7 years of secondary. The number of primary years varies from 4 to 10, while the number of secondary years varies from 2 to 7. Completing the primary level in Kazakstan, which consists of only 4 years of schooling, is not comparable to completing the primary level in Jordan, which consists of 10 years of schooling. Nevertheless, because completing a given level of an educational system in a country carries both symbolic and practical significance, information on attainment by level is important.

The left-most sections of the bars in Figure 3.5 show the percent of the population 15+ with no schooling, that is, those who had never even entered the first grade. These percentages are very close to the percentage of the population with "0" years of education in section 3.1, and once again demonstrates the wide variation in educational attainment among the 39 countries studied in this report.

The right-most sections of the bars, on the other hand, show the percent of the population 15+ with at least a completed secondary education. These percentages vary widely as well, from levels as low as one-half a percent in Niger to more than two-thirds in Kazakstan.

Of the many possible measures of gender differences in educational attainment by level, differences in percent having at least some secondary education are presented in Figure 3.6. Three countries of South Asia (India, Nepal, and Pakistan) share the dubious distinction of having the largest gender differences in favor of males. At the other extreme, 3 countries in Latin America/Caribbean (Brazil NE, Colombia, and the Dominican

Republic) and 1 country in sub-Saharan Africa (Namibia) have gender differences favoring females, although never by more than 4 percentage points.

3.3 RURAL-URBAN DIFFERENCES IN ATTAINMENT

Large rural-urban differentials exist in measures of attainment, just as is the case with attendance. Only one of these measures—the median number of years of education—is briefly examined here.

Educational attainment in rural areas lags considerably behind educational attainment in urban areas. In none of 38 countries are rural median years of education as high as urban medians (Figure 3.7). In only 4 countries (Jordan, Kazakstan, Tanzania, and Turkey) are rural medians as high as 80 percent of urban medians. Rural medians less than 20 percent of urban medians are found in 12 countries.

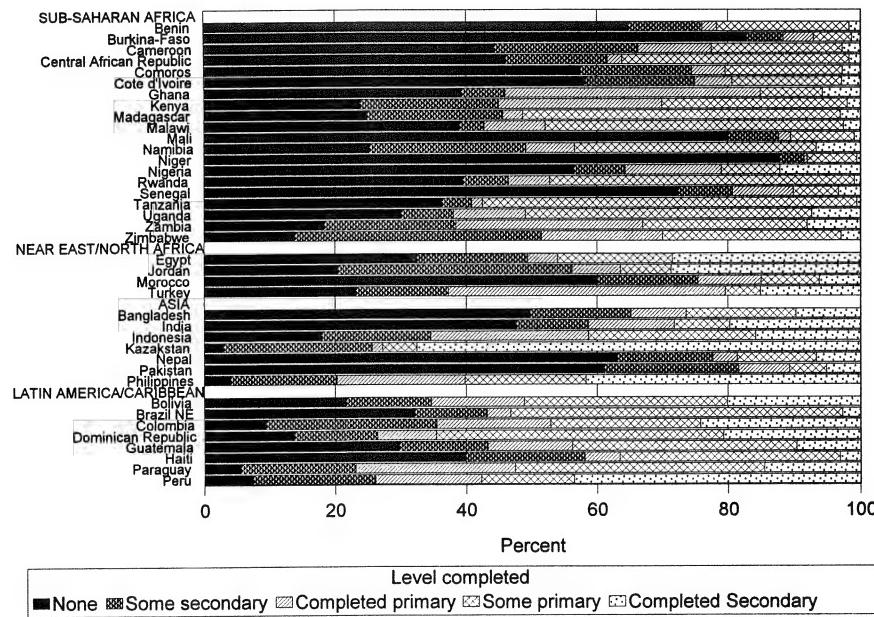

Rural-urban differences in educational attainment by gender are detailed in Appendix Table A3.3. Both males and females show consistently lower median years of education in rural areas than in urban areas. In 17 countries, female rural-urban ratios in median years of education are greater than male rural-urban ratios. In the other 21 countries, rural females are "doubly disadvantaged" by their gender and by their rural residence.

Patterns of change in basic educational attainment, as shown by median years of education for different age groups, demonstrate an almost universal improvement both in rural and in urban areas for the countries studied. Medians are usually higher for the youngest age group, 15-24, than for the next age group, 25-34, and those percentages in turn are usually higher than for the age group 35-49. Moreover, the ratio of rural-to-urban medians has also been improving in more than one-half of the countries observed. Improvement is not so apparent when absolute differences between rural medians and urban medians are compared. This illustrates the problems inherent in trying to compare percentages when they move over a large span from low percentages to high percentages, and this makes it harder to unequivocally state that urban bias is lessening.

3.4 ILLITERACY AND READING ABILITY

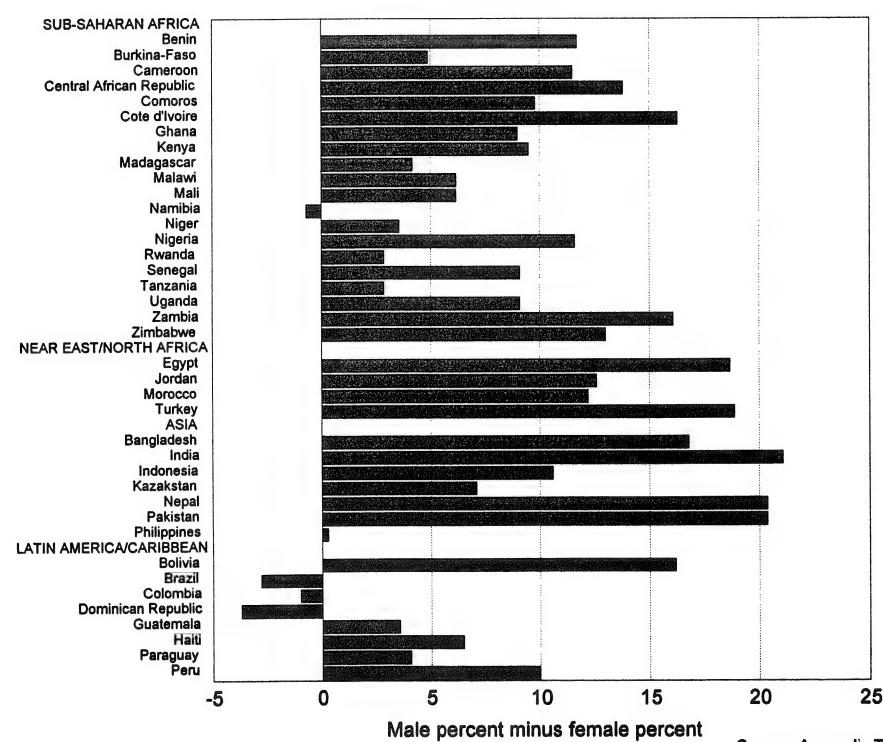

The ability to read is a crucial measure of education in a country, even more than years or level of schooling. Reading ability can be achieved through schooling, of course, but it can also be achieved outside of school. Conversely, having attended a particular number of years of school does not necessarily mean that a person can read, although at some point one must assume that progress beyond a certain grade presupposes reading ability.

Figure 3.5 Distribution of population 15+ by level of schooling completed

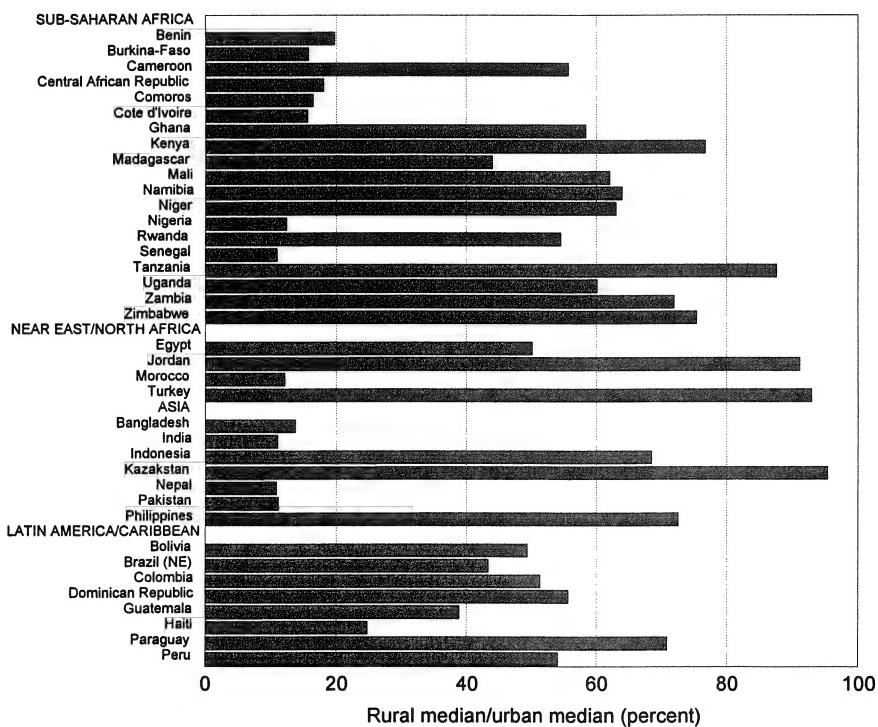

Source: Appendix Table A3.2.

Figure 3.6 Male minus female percentages with at least some secondary education among those 15+

Source: Appendix Table A3.2.

Figure 3.7 Ratio of rural to urban median years of education for population ages 15-49

Source: Appendix Table A3.3.

Measuring literacy is not quite as easy as measuring years or level of schooling attained. As noted above, in the DHS reading ability is ascertained by asking all women age 15-49, with a primary education or less, the question *Can you read and understand a letter or a newspaper easily, with difficulty, or not at all?* Two individuals who might score the same on an “objective” reading test might nevertheless answer this question differently. In addition, deliberate misreporting by respondents cannot be ruled out.

According to UNESCO data, illiteracy varies with level of development. Illiteracy is practically nonexistent in the world’s developed countries, while among the least-developed countries, more than 50 percent of those age 15 and above were illiterate in 1995 (Figure 3.8). The region with the highest levels of illiteracy is South Asia (50 percent), which is followed by sub-Saharan Africa and the Arab States (both around 43 percent). Much better off are East Asia and Oceania (16 percent), Latin America and the Caribbean (13 percent), and countries of the developed world (1 percent).

Among the illiterate population, females predominate everywhere. The lowest regional ratios of percent illiterate among females to percent illiterate among 100 males are found in America (117) and in Latin America and the Caribbean (118); the highest regional ratios are found in East Asia and Oceania (252). These figures reconfirm the impression of gender inequality in education that the data on attendance and attainment presented.

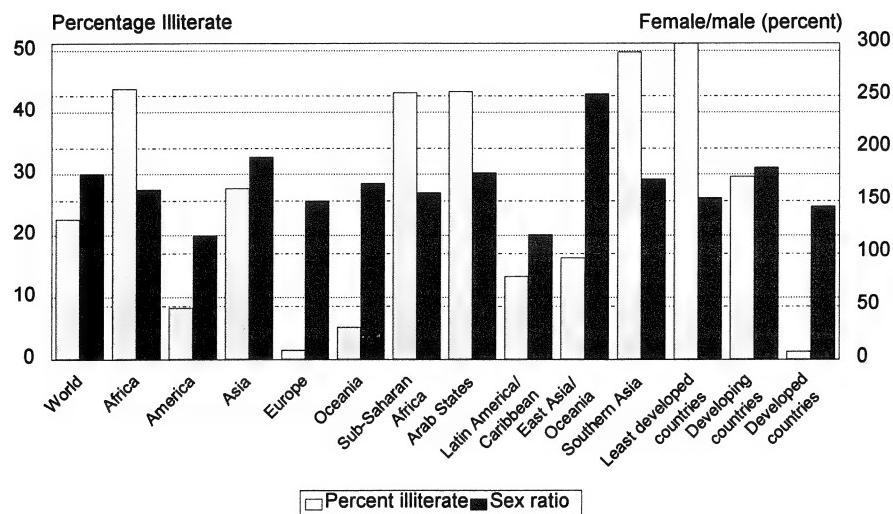

Illiteracy fell in all regions of the world between 1980 and 1995. Proportionate changes were greatest in South Asia and were least in the least-developed countries. Absolute falls in percent illiterate were greatest in Africa, especially sub-Saharan Africa, and were smallest in the developed countries. Female illiteracy fell faster than male illiteracy everywhere, when measured by absolute change in percent illiterate, but not necessarily faster, when measured by proportionate change.

We now turn to DHS data on literacy. In contrast to UNESCO regional data on illiteracy, which refer to the entire adult population, the DHS data on reading ability pertain only to women age 15-49. Data in Appendix Table A3.4 include percentages who cannot read, percentages who read with difficulty, and percentages who read easily.¹⁷

Very high levels of illiteracy among women are shown by numerous countries (Figure 3.9). In 3 countries (Burkina Faso, Mali, and Niger), more than 80 percent of women age 15-49 report that they cannot read. In 8 more countries the percentage is between 60 and 80. In contrast, less than 20 percent illiterate are found in 9 countries, and 5 of them (Bolivia, Colombia, the Dominican Republic, Paraguay, and Peru) are in Latin America/Caribbean.

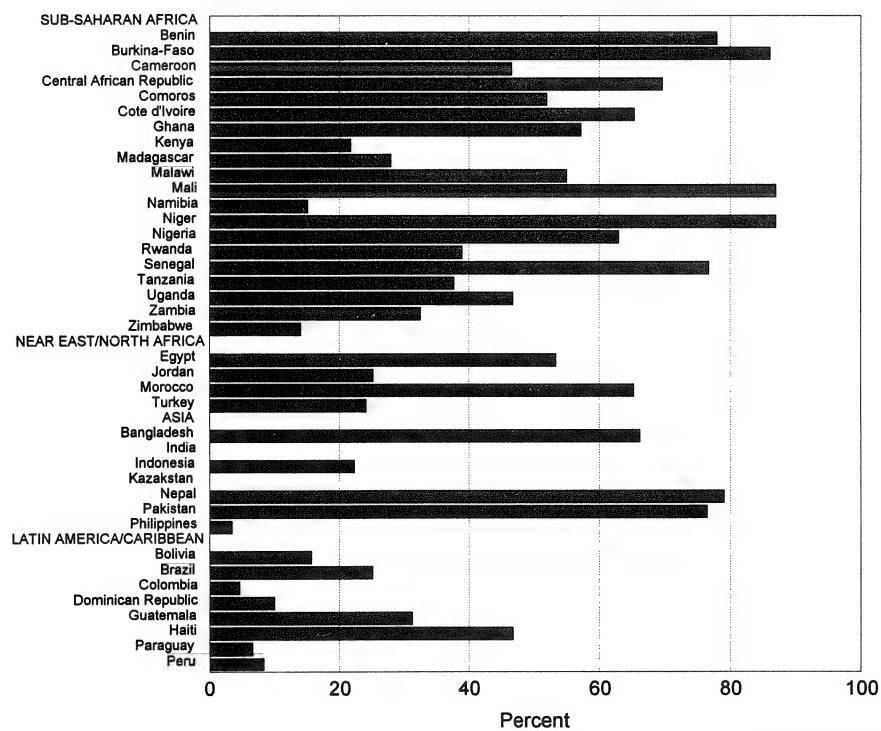

¹⁷ Although in DHS the reading ability question was only asked of women with no more than a primary education, the tables include women with more than a primary education and assume that they are all able to read.

Figure 3.8 Percentages illiterate and sex ratios (female/male) of percentages illiterate among those 15 and older, by region, 1995

Source: UNESCO 1996 Statistical Yearbook, Table 2.2.

Figure 3.9 Percent of all women 15-49 who cannot read

Source: Appendix Table A3.4.

Age patterns of illiteracy vary considerably (Figure 3.10). In some countries, such as the Philippines, women of all ages have low and almost constant levels of illiteracy, with levels for older women not much higher than levels for younger women. Fairly constant levels are also found for women of different ages in Pakistan, but in this country illiteracy never falls below 70 percent at any age.

A number of countries show levels of female illiteracy that have fallen over time, that is, illiteracy is lower for younger women. In Burkina Faso, for example, illiteracy has fallen steadily; however, levels for young women are still high. In contrast, in Kenya, Rwanda, and Zimbabwe steady falls in illiteracy have resulted in low levels among the youngest women.

3.5 RURAL-URBAN DIFFERENCES IN READING ABILITY

Rural-urban differences in reading ability parallel those in attendance and attainment (Appendix Table A3.5). In every country rural levels of illiteracy among women age 15-49 are higher than urban levels (Figure 3.11), and in every country the

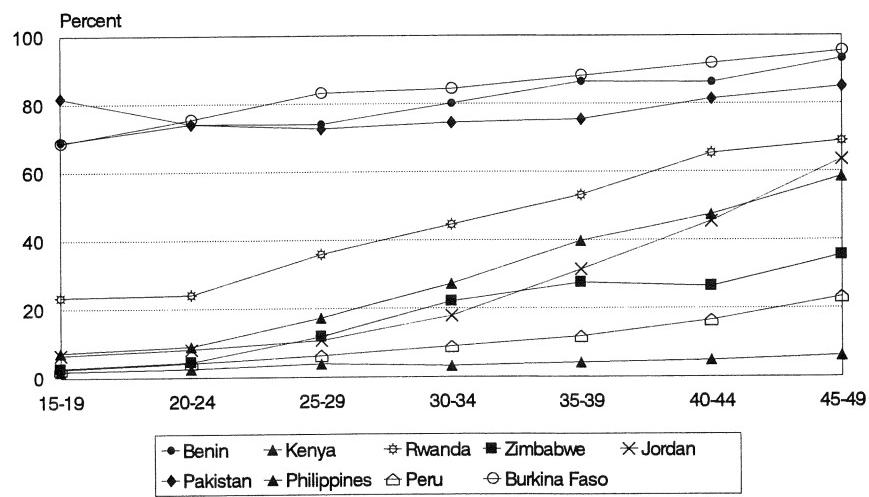

rural percentages of “reads easily” are lower than urban percentages.

3.6 ILLITERACY AND EDUCATION

As mentioned previously, not having gone to school does not preclude literacy. For example, among women age 15-49 with no education, more than 8 percent in Colombia said they could read easily and 13 percent more said they could read with difficulty (Table 3.2). In Namibia as well, more than 20 percent of those with no education said they could read easily or with difficulty. In these countries there is clearly some learning going on in adult literacy programs or outside the formal educational system. For most countries, however, levels of literacy are low for women with no schooling.

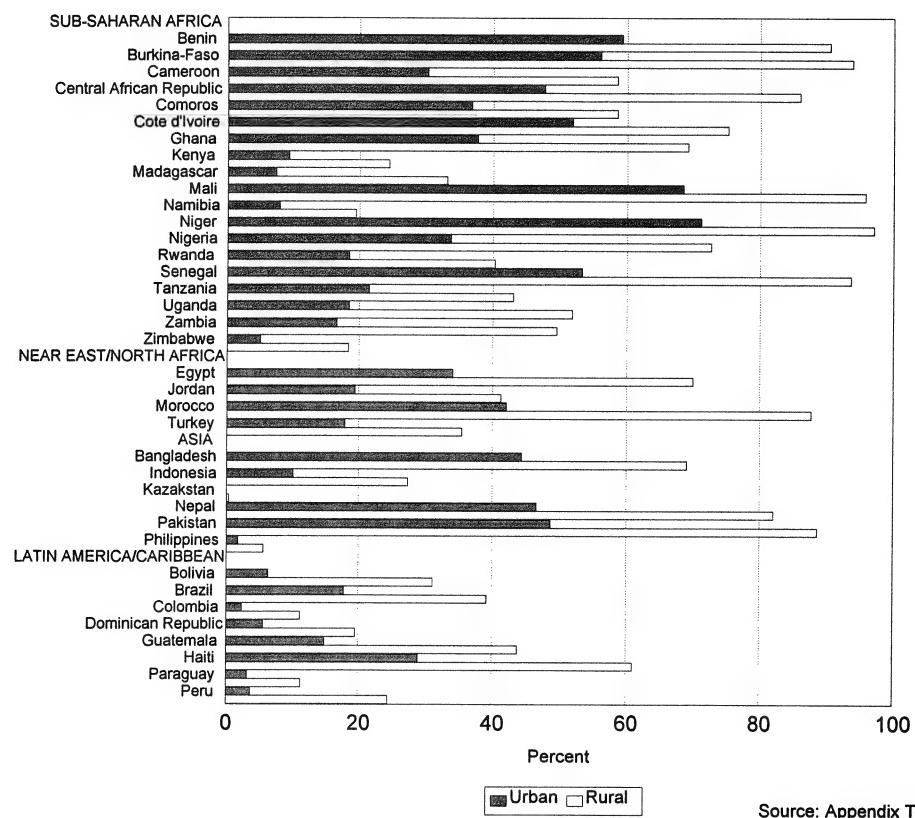

Going to school does not guarantee literacy. Among women age 15-49 with some or completed primary education but no more, levels of illiteracy are more than 52 percent in the Central African Republic and Mali. Double-digit levels of illiteracy among women with some or all primary schooling are also found in 27 of 37 countries, including 16 of 20 sub-Saharan African countries.

4 Conclusions

The data presented in this report confirm the continuing existence of major differences in educational attendance levels and attainment across and within regions and countries. Attendance levels for children aged 6-14, for example, range from 16 percent in Niger to more than 80 percent in 10 countries. Median numbers of years of schooling range from less than 1 full year in 11 countries, mostly in sub-Saharan Africa, to 10.6 years in Kazakhstan and at least 6 years in 13 other countries.

From a regional point of view, among the countries with DHS surveys, those of sub-Saharan Africa seem to have made the least educational progress, while those of Latin America/Caribbean seem to have made the most educational

progress. Within each region, however, there is a great deal of country-to-country variation.

Substantial variations in educational levels are found within countries with respect to gender, age, and rural-urban residence. In general, these variations are in the expected direction: Males have higher educational attendance and attainment than females, younger age groups are generally better educated than older age groups, and the populations of urban areas are better educated than the populations of rural areas. More often than not, the age data indicate that gender and residential differentials have been growing smaller.

Appendix A

Table A1.1 Human development index

UNDP human development index for countries in this report

Region and country	1992 Human Development Index*	Gross Domestic Product Rank**	Per Capita
Sub-Saharan Africa			
Benin	0.332	155	\$1,630
Burkina Faso	0.228	169	810
Cameroon	0.503	127	2,390
Central African Republic	0.361	149	1,130
Comoros	0.415	139	1,350
Côte d'Ivoire	0.369	145	1,710
Ghana	0.482	129	2,110
Kenya	0.481	130	1,400
Madagascar	0.432	135	710
Malawi	0.330	157	820
Mali	0.222	172	550
Namibia	0.611	108	4,020
Niger	0.207	174	820
Nigeria	0.406	141	1,560
Rwanda	0.332	156	710
Senegal	0.340	152	1,750
Tanzania	0.329	158	620
Uganda	0.364	147	860
Zambia	0.425	136	1,230
Zimbabwe	0.539	121	1,970
Near East/North Africa			
Egypt	0.613	107	3,540
Jordan	0.758	80	4,270
Morocco	0.554	117	3,370
Turkey	0.792	66	5,230
Asia			
Bangladesh	0.364	146	1,230
India	0.439	134	1,230
Indonesia	0.637	104	2,950
Kazakhstan	0.798	64	4,270
Nepal	0.343	151	2,890
Pakistan	0.483	128	1,170
Philippines	0.677	100	2,550
Latin America/Caribbean			
Bolivia	0.588	113	2,410
Brazil (NE)	0.804	63	5,240
Colombia	0.836	57	5,480
Dominican Republic	0.705	96	3,280
Guatemala	0.591	112	3,330
Haiti	0.362	148	1,046
Paraguay	0.723	87	3,390
Peru	0.709	93	3,300

Source: UNDP 1995, Table 1.

* A measure of the average achievement of a country in basic human capabilities; it includes measures of life expectancy, education, and income.

** Rank among 174 countries listed in source table.

Table A2.1 School attendance rates

Percent of household population aged 6-14 currently attending school, by age and sex

Region, country, and age	Total	Male	Female	Female/ male	Female/ male ×100	Total children 6-14
Sub-Saharan Africa						
Benin						
Ages 6-14	42.7	52.8	32.1	20.8	60.7	7,380
6-7	31.1	34.3	27.9	6.4	81.4	1,949

Grade 6	25.7	26.7	24.6	2.1	92.2	1,994

Note: The percentages are calculated in the following way. From Table 1.1, for each country the appropriate age for children entering first grade is ascertained (and for the following grades, by adding 1 year of age per grade). The appropriate ages for children in each grade will be the entering age and the next age. For example, if the entering age in Grade 1 is 6, then the appropriate ages for first graders is 6 and 7.

The denominator is the total number of children in a given grade. The numerator is all of the "behind grade" children in that grade, that is, those for whom actual age minus appropriate age is greater than 2. For example, for first grade in a country where the entering age is 6, the denominator will be all first graders, and the numerator will be all first graders who are 10 or older. That is, $10 - 7 > 2$.

C.A.R. = Central African Republic

¹ Procedures in India preclude calculation of data for grade six.

Note: Continuation rates are calculated as follows: Denominators are all individuals 15-49 who have at least some primary, who have completed primary, or who have at least some secondary education, respectively. Numerators are all individuals 15-49 who have at least completed primary, who have at least some secondary, and who have at least completed secondary education, respectively. Figures in this table differ from those in a similar table, 4.2, of DHS Comparative Study, No. 21. The age range in the latter table was 15 and above. C.A.R. = Central African Republic.

Note: Literacy question was only asked of women who had not progressed beyond primary grades. Data in this table assume that women with more than a primary education can read.

Figures in parentheses are based on 25-49 cases.

- Not shown because based on fewer than 25 cases.
